Ecology Programm

FALU

Recent market trends in Europe clearly show a substantially increased ecological awareness of the major distributors. Falu always has and increasingly does pay attention to the environment in the following ways:

Swab machines

- We build long lasting robust machines with a 30 years plus life span. One of our targets of the development strategy is the protection of customers investment. Wherever possible and feasible we endeavour to make modules and enhancements backwards compatible thus protecting investments and resource. This means, for example, that our draft module can be fitted to all the previously sold machines. This is even valid for machines of our fellow competitors provided that the integration is carried out by our customers.

Swabs

- Our carrier system is ideally suited to work with ecologically friendly, compostable cotton swabs where stems are made of paper, wood or even bamboo

Packages

- Our packaging machines, especially the SQB-2A, are well suited to pack ecofriendly raw material like cardboard

Compostable swabs

- Falu is able to offer several solutions regarding machines to produce paper stems. Contact us for more information
- Falu has a long standing project to develop a new compostable material less expensive than then conventional paper swabs. Despite some past difficulties we are working hard on this project and expect to deliver results in time for the new trend.
